### **POINTS TO REMEMBER**

**STANDING OR SITTING:** Do not slouch. Keep entire back pressed to the back of the chair. Do not hold head and chin up and your neck drawn back. Hold chin tucked in.

**LIFTING OR REACHING:** Always bend knees using your leg muscles to lift. Keep load close to your body when lifting. Avoid reaching needlessly. Use a step stool to avoid stretches and strains.

**DRIVING:** Do not slouch. Sit high in the seat which should be positioned comfortably from pedals and steering wheel. A support pad may help relieve pressure on the lower back.

**EXERCISE:** Begin a regular program once the pain has subsided. Begin slowly and allow your muscles and body to warm up. Consult your doctor on appropriate activity best suited for your condition.

**NOTE:** Exercise is an important adjunct to your treatment. However, be sure to follow your doctor's instructions carefully. Do not overdo exercise, particularly when beginning. Start by trying movements slowly and carefully. If the exercise causes some mild discomfort, which lasts a few minutes, do not be alarmed. This will disappear as your muscles become stronger. But, if pain is more than mild and continues for more than 15 to 20 minutes, discontinue exercising and speak to your doctor.
